

Sales trend analysis

The purpose of this report is to analyze sales trends by product category and country.

The report analyzes sales trends based on a table containing 1,246 orders from 45 countries for the years 2010–2017. The analysis shows that products were sold primarily in Europe and Western Asia.

To facilitate the analysis, results from 2016 and 2017 were taken into account.

The analysis shows that the most popular categories during this period were: Beverages (12.08%), Fruits (9.81%), and Snacks (9.81%). The least popular category was Cereals (3.77%).

The categories that generated the highest profit were: Cosmetics (19.94%), Household (16.52%), and Office Supplies (16.26%), while the Fruits category generated the lowest profit (0.37%).

The Office Supplies category generated the highest revenue (24.73%), but it also recorded the highest costs (28.28%).

The countries with the highest revenue were Macedonia (5.88%), Andorra (5.45%), and San Marino (5.16%). These countries also recorded the highest costs and profits.

The analysis shows that the distribution of profit from online and offline orders is roughly equal, with a slight advantage for offline orders (54.1% to 45.9%).

No significant correlation was observed between profit and order fulfillment time; however, it is worth noting that orders for products in the Office Supplies category take the longest to fulfill on average.

The data shows that the shortest average order fulfillment time is in Croatia (7 days), and the longest is in the Czech Republic (33 days).

It can be observed that the Office Supplies category achieved its highest sales in the first half of 2016 and in March, May, and July 2017. In the first half of 2017, the Household category generated significant revenue.

The number of products sold increased around the weekend (from Thursday to Monday).

The analysis showed that the Office Supplies, Household, and Cosmetics categories had the greatest impact on financial results. Sales were concentrated in several European countries, with a relatively equal share between online and offline channels. A Pareto analysis confirmed that over 80% of revenue is generated by six product categories. The results suggest that activities related to inventory management, marketing, and sales planning should focus primarily on these categories.
